                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δÃ
                                                                                                                                                                                                                                                               Example 28; Pages 213-217; 272pp; English.

PS Example 28; Pages 213-217; 272pp; English.

PS This is the beta-domain deleted SQN deletion protein of human factor CC This is the beta-domain deleted SQN deletion protein of human factor CC VIII. The encoding DNA is used to construct recombinant retroviral CC vectors expressing human factor VIII. The invention provides the CC preparation of replication defective recombinant retrovirus (RRV) CC degradation by human complement and is capable of inducing long term CC systemic expression of the therapeutic protein when administered CC intravenously to a human. The long term systemic expression results in a CC measurable level of the therapeutic protein being produced in the blood CC measurable level of the therapeutic protein being produced in the blood CC measurable level of trat, e.g. haemophilia A, haemophilia B, CC thrombosis, hypercoagulable disorders, liver diseases such as hepatitis, CC disorders such as thalassemia, phenylketonuria, Lesch-Nyhan syndrome, CC disbetes, hypopituitarism, adenine deaminase deficiency, alphal-CC diabetes, hypopituitarism, adenine deaminase deficiency, alphal-CC diabetes, hypopituitarism, adenine deaminase deficiency, alphal-CC antitrypsin deficiency, Guacher's syndrome, anaemia, infections such as CC HIV infection, high blood pressure, Alzheimer's disease, auctoimmune or inflammatory disease or graft versus host disease. RRV's are capable of Surviving inactivation in human serum thereby allowing efficient gene CC serumence 1457 AA:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           δÃ
CC sequence is part of a novel vector, comprising an intronless gene containing 1 or more near consensus splice sequences operably linked to CC a promoter sequence so that the gene is transcribed in a cell. CC Intronless gene transcripts which contain near consensus splice site sequences are believed to get tied up in the nucleus of the cell where splicing occurs, rather than being transported to the cytoplasm where they can be translated into proteins. The PRE sequences are transcribed along with the gene, causing export of the gene transcript from the cucleus into the cytoplasm of the cell. The vector can be used to increase the expression of an intronless gene containing at least one can consensus splice sites, preferably cDNA encoding a blood coagulation factor, particularly Factor VIII or IX. The complex allows the targeted delivery of the vector to a specific cell, e.g. hepatocytes when the cligand is an asialoglycoprotein which binds the asialoglycoprotein to receptor present on their surface.
                                                                                                                                                                                                                                                                                        The present sequence represents human B-domain deleted factor VIII The cDNA encoding this protein also contains, 3' of the coding region, post-translational regulatory element (protein) of the Hepatitis B virus. PRE sequences have been shown to function in cis to increase the steady-state levels of surface gene transcripts by facilitating cytoplasmic accumulation of these transcripts. The above nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bidlingmaier S, II

prediction comprising two chains linked by segment of B domain.
protein is a fusion between Phe 742 and Ser 1637 of the factor
vIII protein (factor VIII:SQ). In order to produce a
vIII protein (factor VIII:SQ). In order to produce a
rector VIII deletion derivative that can be produced in vivo and/or
vivo and so the atwo chain protein consisting of polypeptide chains of
vivo and 80 kD, the amino acid sequences surrounding Arg 740 and
vivo and so the sequences surrounding Arg 740 and
vivo and so the factor vIII protein order to preserve the structural
vivo acids of the full-length factor vIII polypeptide are deleted. A
vivo acids of the full-length factor vIII polypeptide are deleted. A
vivo acids of the sequence of the five N-terminal ones directly corresponds to the five amino acids, the sequence
vivo acids following Arg 740 in full-length factor vIII. Also, the sequence
vivo acids following Arg 740 in full-length factor vIII. Also, the sequence
vivo acids following Arg 740 in full-length factor vIII. Also, the sequence
vivo acids following Arg 740 in full-length factor vIII. Also, the sequence
vivo and c-terminal amino acids of the above 14 amino acids fragment
vivo and c-terminal regions of the B-domain.
vivo and c-terminal regions of the B-domain acid overlap between the
vivo and c-terminal regions of the B-domain acid overlap between the
vivo and c-terminal regions of the B-domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Factor VIII: SQ.

Pri New DNA sequences encoding modified factor VIII:C - with deletion of DNA encoding maturation polypeptide, useful for high yield transformation. Pri encoding maturation polypeptide, useful for high yield transformation. Pri encoding maturation polypeptide of the sequence encoding the maturation polypeptide of factor VIII:C is deleted, i.e. Gln 744 - Asp 1563. The QD deletion retains approximately 90 maino acids of the maturation polypeptide (four amino acids at the N-terminal end and 86 amino acids at the C-terminal end). The full lenght Factor VIII:C cDNA has two changes with respect to the published sequence (EPO application 160457): CTG to CTA at Leu 242 and TTC to CTC change at amino acid residue 1880 (Phe to Leu).

The product is produced in approx. 20 times higher yields than previous recombinant produced factor VIII:C and are more easily purified. The peptide is used for treating haemophilia A, both See also N80446 and N80447.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Qy
                                                                                                 N-PSDB; N80446.

New DNA sequences encoding modified factor VIII:C - with deletion of DNA recommendation polypeptide, useful for high yield transformation. The encoding maturation polypeptide, useful for high yield transformation. Straim 3; Page 57-58-59-60; 97pp; English.

The entire sequence encoding the maturation polypeptide of factor VIII:C is deleted, i.e. Arg 740-Glu 1649.

The full lenght Factor VIII:C CDNA has two changes with respect to the published sequence (EPO application 160457):

Cyfe to CTA at Leu 242 and TTC to CTC change at amino acid residue 1880 (Phe to Leu). The product is produced in approx. 20 times higher yields than previous recombinant produced factor VIII:C and are more easily purified. The peptide is used for treating haemophilia A, both acute and prolonged bleeding.

VIII, along with calcium and phospholipid, acts as a cofactor for factor CC IXA, when it converts factor X to the activated form (factor XA). FVIII CC is the coagultion factor deficient in the X-chromosome-linked bleeding disorder haemophilia A. Several other mutant FVIII proteins have also been created (see W33222-29). The FVIII mutant F309S (W33225) is capable of recombinant secretion at higher levels than typically obtained with CC wild type FVIII and retains pro-coagulant activity. The FVIII mutant CC R336I (W3322) and R562K (W33223) are resistant to activated protein CC (APC) cleavage. The present FVIII mutant can form a more stable configuration, and have an approximate 5-fold increase in specific activity compared to purified wild type FVIII, while increasing their Dinding affinity to von Willebrand factor improves their stability. The FVIII proteins can be administered to haemophiliacs, i.e. FVIII can replacement therapy, while the nucleic acid molecule can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                        The present sequence represents a novel pro-coagulant active factor VIII (FVIII) mutant protein, comprising a deletion of the B domain and convenient of the B domain and sold sequence spacer between the A2 and A3 domains. Factor VIII, along with calcium and phospholipid, acts as a cofactor for factor VIII, along with calcium and phospholipid, acts as a cofactor for factor VIII, along with calcium and phospholipid, acts as a cofactor for factor VIII, along with calcium and phospholipid, acts as a cofactor for factor VIII, along with calcium and phospholipid, acts as a cofactor for factor VIII, along with calcium and phospholipid, acts as a cofactor for factor viii, along with calcium and phospholipid, acts as a cofactor for factor viii, according to the mutant FIVIII proteins have also been created (see w33222-29). The FVIII mutant FIVIII proteins have also been created (see w33222-29). The FVIII mutant FIVIII young FVIII and retains pro-coagulant activity. The FVIII mutant CC (ABC) cleavage. The present FVIII mutant can form a more stable configuration, and have an approximate 5-fold increase in specific activity compared to purified wild type FVIII, while increasing their binding affinity to von Willebrand factor improves their stability. The FVIII proteins can be administered to haemophiliacs, i.e. FVIII creplacement therapy, while the nucleic acid molecule can be used for

PT administered to naemopnilians, i.e. recombinistered to naemopnilians, for the present sequence represents a novel pro-coagulant active factor VIII (FVIII) mutant protein, comprising a deletion of the B domain and CC von Willebrand factor binding site, mutations R336I, R562K and R740A and CC an addition of an amino acid sequence spacer between the A2 and A3 CC and addition of an amino acid sequence spacer between the A2 and A3 CC domains. Factor VIII, along with calcium and phospholipid, acts as a cofactor for factor IXA, when it converts factor X to the activated form CC (factor XA). FVIII is the coagultion factor deficient in the cofactor X() for the activated form CC (factor XA). FVIII is the coagultion factor at higher levels than the coagultion factor deficient in the CC X-chromosome-linked bleeding disorder haemophilia A. Several other mutant CC (FVIII proteins have also been created (see W33222-29). The FVIII mutant CC typically obtained with wild type FVIII and retains pro-coagulant activity. The FVIII mutant R336I (W3322) and R562K (W3323) are resistant to activated protein C (APC) cleavage. The FVIII mutant CC comprising a deletion of the B domain and von Willebrand factor binding site, a mutation at Arg740 and an addition of an amino acid configuration, and have an approximate 5-fold increase in specific activity compared to purified wild type FVIII, while increasing their binding affinity to von Willebrand factor improves their stability. The FVIII proteins can be administered to haemophiliacs, i.e. FVIII configurations, and have an approximate 5-fold molecule can be used for replacement therapy, while the nucleic acid molecule can be used for

CC Will30-Wil472 represent active Factor VIII:C analogues of the invention.

CC Wilso-Wil472 represent active Factor VIII:C analogues of the invention.

CC These sequences were created by mutating the wild type Factor VIII:C coding sequence (see T51357) using mutagenic primers. The analogues comprise a native Factor VIII:C polypeptide modified at a site adjacent to a non-activating Arg residue so that a Arg-Pro or Pro-Arg dipeptide is created. Factor VIII:C is a large glycoprotein that participates in the blood coagulation cascade that ultimately converts soluble fibrinogen to Cinsoluble fibrin clot, effecting haemostasis. A deficiency in Factor VIII:C is responsible for haemophilia A, which is an X-chromosome-linked inherited bleeding diathesis. Factor VIII:C is activated by plasma crivated bleeding diathesis. Factor VIII:C is activated by plasma converses, such as thrombin. During activation the mature polypeptide is cleaved to generate heavy and light chain fragments that are further cleaved. Complexes of two or more of the analogues, nucleic acids and concluded. Complexes of two or more of the analogues, nucleic acids and concluded. Complexes of two or more of the analogues, nucleic acids and concluded. For the prevention or treatment of active Factor VIII:C deficiency in a mammal. The analogues may be used as immunogens to raise antibodies, and in the treatment of haemophiliacs, by improvement of haemostasis. The canalogues are resistant to proteolytic cleavage and display increased considered to the context of administration.

PS Claim 29; Page -; 90pp; English.
CC Will330-Wil4/72 represent active Factor VIII:C analogues of the invention.
CC Will330-Wil4/72 represent active Factor VIII:C coding sequence (see T51357) using mutagenic primers. The analogues coding sequence (see T51357) using mutagenic primers. The analogues coding sequence (see T51357) using mutagenic primers. The analogues coding sequence (see T51357) using mutagenic primers. The analogues comprises a native Factor VIII:C polypeptide modified at a site adjacent code non-activating Arg residue so that a Arg-Pro or Pro-Arg dipeptide is created. Factor VIII:C is a large glycoprotein that participates in the blood coagulation cascade that ultimately converts soluble fibrinogen to insoluble fibrin clot. effecting haemostasis. A deficiency in Factor VIII:C is responsible for haemophilia A, which is an X-chromosome-linked inherited bleeding diathesis. Factor VIII:C is activated by plasma proteases, such as thrombin. During activation the mature polypeptide is cleaved to generate heavy and light chain fragments that are further cleaved. Complexes of two or more of the analogues, nucleic acids and vectors encoding them may be used alone or in conjunction with each other, for the pravention or treatment of active Factor VIII:C deficiency in a mammal. The analogues may be used as immunogens to raise antibodies, and in the treatment of haemophiliacs, by improvement of haemostasis. The analogues are resistant to protectolytic cleavage and display increased claim and the claim of the protectory of administration.

CC Will330-Wil1472 represent active Factor VIII:C analogues of the invention. CC Will30-Wil1472 represent active Factor VIII:C analogues of the invention. CC These sequences were created by mutating the wild type Factor VIII:C CC coding sequence (see T51357) using mutagenic primers. The analogues CC comprise a native Factor VIII:C polypeptide modified at a site adjacent CC to a non-activating Arg residue so that a Arg-Pro or Pro-Arg dipeptide is CC created. Factor VIII:C is a large glycoprotein that participates in the CC blood coagulation cascade that ultimately converts soluble fibringen to CC insoluble fibrin clot, effecting haemostasis. A deficiency in Factor CC vIII:C is responsible for haemophilia A, which is an X-chromosome-linked inherited bleeding diathesis. Factor VIII:C is activated by plasma CC cleaved to generate heavy and light chain fragments that are further CC cleaved to generate heavy and light chain fragments that are further CC cleaved. Complexes of two or more of the analogues, nucleic acids and vectors encoding them may be used alone or in conjunction with each CC other, for the prevention or treatment of active Factor VIII:C deficiency in a mammal. The analogues may be used as immunogens to raise antibodies, and in the treatment of haemophiliacs, by improvement of haemostasis. The canalogues are resistant to proteolytic cleavage and display increased CC different modes of administration.
